**SUBSTITUTED ISOXAZOLES
FOR THE TREATMENT OF INFLAMMATION**

FIELD OF THE INVENTION

5 This invention is in the field of antiinflammatory pharmaceutical agents and specifically relates to compounds, compositions and methods for treating inflammation and inflammation-associated disorders, such as arthritis.

10 **BACKGROUND OF THE INVENTION**

Prostaglandins play a major role in the inflammation process and the inhibition of prostaglandin production, especially production of PGG₂, PGH₂ and PGE₂, has been a common target of antiinflammatory drug discovery. However, common non-steroidal antiinflammatory drugs (NSAIDs) that are active in reducing the prostaglandin-induced pain and swelling associated with the inflammation process are also active in affecting other prostaglandin-regulated processes not associated with the inflammation process. Thus, use of high doses of most common NSAIDs can produce severe side effects, including life threatening ulcers, that limit their therapeutic potential. An alternative to NSAIDs is the use of corticosteroids, which have even more drastic side effects, especially when long term therapy is involved.

Previous NSAIDs have been found to prevent the production of prostaglandins by inhibiting enzymes in the human arachidonic acid/prostaglandin pathway, including the enzyme cyclooxygenase (COX). The recent discovery of an inducible enzyme associated with inflammation (named "cyclooxygenase-2 (COX-2)" or "prostaglandin G/H synthase II") provides a viable target of inhibition which more effectively reduces inflammation and produces fewer and less drastic side effects.

The references below that disclose antiinflammatory activity, show continuing efforts to

find a safe and effective antiinflammatory agent. The novel isoxazoles disclosed herein are such safe and also effective antiinflammatory agents furthering such efforts. The invention's compounds are found to show usefulness in vivo as antiinflammatory agents with minimal side effects. The substituted isoxazolyl compounds disclosed herein preferably selectively inhibit cyclooxygenase-2 over cyclooxygenase-1.

Isoxazoles have been described for various uses, including the treatment of inflammation. DE 4,314,966, published November 10, 1994, describes 3-(2-hydroxyphenyl)isoxazoles for the treatment of inflammatory disorders. WO 92/05162, published April 4, 1992, describes 5-piperazinyl-3,4-diaryl-isoxazoles as having medicinal use.

WO 92/19604, published November 12, 1992, describes 5-alkene-3,4-diaryl-isoxazoles as having cyclooxygenase inhibition activity. EP 26928, published April 15, 1981, describes 3,4-diaryl-isoxazole-5-acetic acids as having antiinflammatory activity. WO 95/00501, published January 5, 1995, generically describes 3,4-diaryl-isoxazoles as cyclooxygenase inhibitors.

The invention's isoxazolyl compounds are found to show usefulness in vivo as antiinflammatory agents with minimal side effects.

The term "hydrido" denotes a single hydrogen atom (H). This hydrido radical may be attached, for example, to an oxygen atom to form a hydroxyl radical.

or two hydrido radicals may be attached to a carbon atom to form a methylene (-CH₂-) radical. Where used, either alone or within other terms such as "haloalkyl", "alkylsulfonyl", "alkoxyalkyl" and "hydroxyalkyl", the term "alkyl" embraces linear or branched radicals having one to about twenty carbon atoms or, preferably, one to about twelve carbon atoms. More preferred alkyl radicals are "lower alkyl" radicals having one to about ten carbon atoms. Most preferred are lower alkyl radicals having one to about six carbon atoms.

Examples of such radicals include methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, tert-butyl, pentyl, iso-amyl, hexyl and the like. The term "cycloalkyl" embraces saturated carbocyclic radicals having three to twelve carbon atoms. More preferred cycloalkyl radicals are "lower cycloalkyl" radicals having three to about eight carbon atoms. Examples of such radicals include cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl. The term "cycloalkenyl" embraces partially saturated carbocyclic radicals having three to twelve carbon atoms. More preferred cycloalkenyl radicals are "lower cycloalkenyl" radicals having three to about eight carbon atoms. Examples of such radicals include cyclobutenyl, cyclopentenyl and cyclohexenyl. The term "halo" means halogens such as fluorine, chlorine, bromine or iodine. The term "haloalkyl" embraces radicals wherein any one or more of the alkyl carbon atoms is substituted with halo as defined above. Specifically embraced are monohaloalkyl, dihaloalkyl and polyhaloalkyl radicals. A monohaloalkyl radical, for one example, may have either an iodo, bromo, chloro or fluoro atom within the radical. Dihalo and polyhaloalkyl radicals may have two or more of the same halo atoms or a combination of different halo radicals. "Lower haloalkyl" embraces radicals having one to six carbon atoms. Examples of haloalkyl radicals include fluoromethyl, difluoromethyl, trifluoromethyl, chloromethyl,

dichloromethyl, trichloromethyl, pentafluoroethyl, heptafluoropropyl, difluorochloromethyl, dichlorofluoromethyl, difluoroethyl, difluoropropyl, dichloroethyl and dichloropropyl. The terms 5 "hydroxyalkyl" and "hydroxylalkyl" embrace linear or branched alkyl radicals having one to about ten carbon atoms any one of which may be substituted with one or more hydroxyl radicals. More preferred "hydroxyalkyl" radicals are "lower hydroxyalkyl" radicals having one 10 to six carbon atoms and one or more hydroxyl radicals. Examples of such radicals include hydroxymethyl, hydroxyethyl, hydroxypropyl, hydroxybutyl and hydroxyhexyl. The terms "alkoxy" and "alkoxyalkyl" embrace linear or branched oxy-containing radicals each 15 having alkyl portions of one to about ten carbon atoms. More preferred alkoxy radicals are "lower alkoxy" radicals having one to six carbon atoms. Examples of such radicals include methoxy, ethoxy, propoxy, butoxy and tert-butoxy. The term "alkoxyalkyl" embraces alkyl 20 radicals having one or more alkoxy radicals attached to the alkyl radical, that is, to form monoalkoxyalkyl and dialkoxyalkyl radicals. The "alkoxy" radicals may be further substituted with one or more halo atoms, such as fluoro, chloro or bromo, to provide haloalkoxy 25 radicals. More preferred haloalkoxy radicals are "lower haloalkoxy" radicals having one to six carbon atoms and one or more halo radicals. Examples of such radicals include fluoromethoxy, chloromethoxy, trifluoromethoxy, trifluoroethoxy, fluoroethoxy and 30 fluoropropoxy. The term "cycloalkylalkoxy" embraces radicals having cycloalkyl radicals, as defined above, attached to an alkoxy radical. More preferred "cycloalkylalkoxy" radicals are "lower 35 cycloalkylalkoxy" radicals having cycloalkyl radicals of three to six carbon atoms attached to an alkoxy radical of one to six carbon atoms. Examples of such radicals include cyclohexylmethoxy. The term "aryl", alone or in combination, means a carbocyclic aromatic.

system containing one, two or three rings wherein such rings may be attached together in a pendent manner or may be fused. The term "aryl" embraces aromatic radicals such as phenyl, naphthyl, tetrahydronaphthyl, 5 indane and biphenyl. The terms "heterocyclic" and "heterocyclo" embrace saturated, partially saturated and unsaturated heteroatom-containing ring-shaped radicals, where the heteroatoms may be selected from nitrogen, sulfur and oxygen. Examples of saturated 10 heterocyclic radicals include saturated 3 to 6-membered heteromonocyclic group containing 1 to 4 nitrogen atoms (e.g. pyrrolidinyl, imidazolidinyl, piperidino, piperazinyl, etc.); saturated 3 to 6-membered heteromonocyclic group containing 1 to 2 oxygen atoms 15 and 1 to 3 nitrogen atoms (e.g. morpholinyl, etc.); saturated 3 to 6-membered heteromonocyclic group containing 1 to 2 sulfur atoms and 1 to 3 nitrogen atoms (e.g., thiazolidinyl, etc.). Examples of partially saturated heterocyclic radicals include 20 dihydrothiophene, dihydropyran, dihydrofuran and dihydrothiazole. The term "heteroaryl" embraces unsaturated heterocyclic radicals. GENERAL SYNTHETIC PROCEDURES

The compounds of the invention can be synthesized
 according to the following procedures of Schemes I-XVII,
 wherein the R¹-R⁴ substituents are as defined for
 25 Formulas I-V, above, except where further noted.

Scheme I

Scheme I illustrates the two step procedure used to prepare substituted desoxybenzoin derivatives 3. In step one, 4-methylthiophenylacetic acid 1 is converted to the corresponding acid chloride 2 with thionyl chloride. A variety of aromatic compounds are then acylated with 2 in the presence of a Lewis acid such as aluminum chloride to provide the desired desoxybenzoins 3 in high yield. This Friedel Crafts acylation can be performed in an inert solvent, such as dichloromethane, chloroform, nitrobenzene, 1,2-dichloroethane, 1,2-dichlorobenzene and similar solvents.

Scheme II

15

7

Synthetic Scheme II shows the four step procedure which can be used to prepare substituted ketone compounds 7 from aldehyde 4 and acid 5. In step one, aldehyde 4 and substituted acetic acid 5 are heated together in acetic anhydride and triethylamine to form the 2,3-disubstituted acrylic acids 6 via a Perkin condensation. In step two, the addition of water produces the acids 6 from any mixed acetic-acrylic anhydrides. The acrylic acids 6 are reacted with diphenylphosphorylazide (DPPA) and triethylamine in

toluene at about 0 °C and then at room temperature to form acylazides. The crude acylazides are heated to form a vinyl isocyanat via a Curtius rearrangement. The vinyl isocyanates are trapped with tert-butyl alcohol to produce N-tert-butoxycarbonyl enamine derivatives. Acidic hydrolysis using concentrated HCl provides the substituted ketone 7 intermediates.

Scheme III

10

Synthetic Scheme III illustrates an alternative approach which can be used to prepare substituted ketone intermediates **7** via the Claisen reaction of a substituted phenylacetonitrile **8** and a acid ester **9**. In the first step, a mixture of substituted phenylacetonitrile **8** and acid ester **9** are treated with a base such as sodium methoxide in a protic solvent like methanol to provide the cyanoketone **10**. In step two, the cyanoketone **10** is hydrolyzed in aqueous acid such as concentrated HBr to effect hydrolysis of the nitrile and decarboxylation of the incipient carboxylic acid to produce the substituted ketone intermediates **7**.

Other synthetic approaches are possible to form the desired ketones **7**. These alternatives include reacting the appropriate Grignard or lithium reagents with Weinreb amides of substituted acids or acetic acids.

The Weinreb methodology has been reported in *Tetrahedron Letters*, 4171 (1977).

Scheme IV

5

Synthetic Scheme IV shows the procedure which can be used for the preparation of oxime intermediates 12. Treatment of ketone intermediates 7 with hydroxylamine, generally prepared from hydroxylamine hydrochloride by sodium acetate, provides the oxime intermediates 12. A wide variety of solvents can be used for this reaction including ethanol, toluene and tetrahydrofuran.

15

Scheme V

Synthetic Scheme V shows the procedure which can be used for the preparation of hydrated isoxazole derivatives 13. The substituted oximes 12 are treated with two equivalents of a base such as n-butyllithium in hexanes to produce a dianion which is subsequently acylated.

Suitable acylating agents are anhydrides, acyl imidazoles, esters and the like. Upon quenching the reaction mixture with dilute aqueous acid, hydrated isoxazole derivatives 13 can be isolated by crystallization or chromatography.

5

Scheme VI

10 Synthetic Scheme VI shows the procedure which can be used for the preparation of isoxazole analogs 14 by dehydration of the hydrated isoxazole derivatives 13. Substituted hydrated isoxazoles 13 are dissolved in an appropriate solvent such as toluene and then treated with
15 a catalytic to stoichiometric amount of concentrated sulfuric acid to effect dehydration and thereby produce isoxazole derivatives 14. Other acids can also be employed to effect this transformation such as concentrated HCl, concentrated HBr and many others.

20

Scheme VII

Synthetic Scheme VII shows the procedure which can be used for the preparation of substituted 4-[4-(methylsulfonyl)phenyl]isoxazole analogs 16 from the corresponding 4-[4-(methylthio)phenyl]isoxazoles 15. The oxidation of an aromatic methythio derivative 15 to the corresponding aromatic methylsulfonyl compound 16 can be accomplished in a variety of ways such as with two equivalents of meta-chloroperoxybenzoic acid (MCPBA), two equivalents of Oxone® (potassium peroxyomonosulfate) and many other oxidizing agents.

Scheme VIII

15

17

Synthetic Scheme VIII shows the procedure which can be used for the preparation of substituted 4-(4-amino sulfonyl)phenylisoxazole analogs 17 from the corresponding 4-phenylisoxazoles 14. The procedure is a two step process for the direct introduction of the sulfonamide moiety into 4-phenylisoxazoles 14 or hydrated isoxazoles 13. In step one, isoxazole 14 or hydrated isoxazole 13 is treated at about 0 °C with two or three equivalents of chlorosulfonic acid to form the corresponding sulfonyl chloride. In step two, the sulfonyl chloride thus formed is treated with concentrated ammonia to provide the sulfonamide derivative 17.

Scheme IX

16

17

5

Synthetic Scheme IX shows the three step procedure used to prepare sulfonamide antiinflammatory agents 17 from their corresponding methyl sulfones 16. In step one, a tetrahydrofuran solution (THF) of the methyl sulfones 16 are treated with an alkyl lithium or alkylmagnesium (Grignard) reagent at -78°C , such as *n*-propyl magnesium bromide. In step two, the anion generated in step one is treated with an organoborane, such as tri-*n*-butylborane at -78°C then warmed to room temperature and then heated to reflux. In step three, an aqueous solution of hydroxylamine-*o*-sulfonic acid is added to provide the corresponding sulfonamide antiinflammatory agents 17. This procedure is essentially that of Huang et. al., *Tetrahedron Letters*, 20 35, 7204 (1994).

Scheme X

5 Synthetic Scheme X shows the three step procedure used to prepare sulfonamide antiinflammatory agents 17 from their corresponding methylsulfinyl analogs 18. Methylsulfinyl derivatives 18 are available from the corresponding methylthio compounds 15 by oxidation with 10 one equivalent of an oxidizing agent such as MCPBA. In step one, the methylsulfinyl compounds 18 are treated with trifluoroacetic anhydride to effect Pummerer rearrangement. In step two, the crude Pummerer rearrangement product dissolved in acetic acid is treated 15 with chlorine gas to produce a sulfonyl chloride. In step three, the sulfonyl chloride is converted to the corresponding sulfonamide antiinflammatory agents 17 by treatment with concentrated ammonia. This procedure was adapted from Kharash, J. Am. Chem. Soc., 73, 3240 (1951).

Scheme XI

5 Synthetic Scheme XI shows the two step procedure used to
prepare sulfonamide antiinflammatory agents 17 from their
corresponding 4-phenyl isoxazole derivatives 14. In step one
a mixture of sulfonyl chloride and dimethylformamide (DMF)
are allowed to react at room temperature and then mixed with
10 4-phenylisoxazoles 14 and heated to about 100 °C. The
sulfonyl chloride thus formed is then treated with an excess
of concentrated ammonia to provide the antiinflammatory
sulfonamides 17.

15

Scheme XII

20 Synthetic Scheme XII shows the three step procedure
used to prepar sulfonamide antiinflammatory agents 20

from 4-phenyl isoxazoles 19. In step one, the 4-phenylisoxazoles 19 are converted into the corresponding sulfonic acid by treatment with sulfur trioxide pyridine complex at about 100 °C. In step two, the sulfonic acid 5 is converted into the sulfonyl chloride by the action of phosphorus oxychloride and in step three the sulfonyl chloride is treated with excess concentrated ammonia to provide the antiinflammatory sulfonamides 20.

10

Scheme XIII

Synthetic Scheme XIII shows the three step procedure 15 used to prepare 4,5-diphenylisoxazole antiinflammatory agents 24 from 1,2-diphenylbutenones 21. In step one, the 1,2-diphenylketones 21 are converted to the corresponding oximes 22 by treatment with hydroxylamine in a manner similar to that shown in Scheme IV. In step two, the oxime 22 is converted to the 4,5-diphenylisoxazole 23 in two steps. The oxime 22 is reacted with potassium iodide and iodine in the presence 20

of base, such as sodium bicarbonate and heated to form the halo intermediate. Sodium bisulfite is added to form the isoxazole 23. The isoxazole 23 is converted to the sulfonamide by any of the procedures shown in Schemes
5 VIII, XI or XII.

Scheme XIV

10

Scheme XIV illustrates the five step procedure for the preparation substituted isoxazole derivatives. In step one substituted desoxybenzoin 25 is converted to the corresponding sulfonamide derivative 26 by first treatment with chlorosulfonic acid followed by conversion of the incipient sulfonyl chloride to the sulfonamide by treatment with aqueous ammonia. In the second step the sulfonamide of 26 is protected as the 2,5-dimethylpyrrole derivative by treatment with acetonylacetone in the presence of hydrochloric acid and ethanol. The 2,5-dimethylpyrrole thus formed is converted into oxime 27 by treatment with hydroxylamine hydrochloride in the presence of sodium

acetat in aqueous ethanol. The oxime 27 is treated with slightly more than two equivalents of lithium diisopropylamide (LDA) and then the resulting dianion is quenched by a suitable acylating agent such as an 5 anhydride, acid chloride, ester, acyl imidazole and the like to afford a hydrated isoxazole. In the last step, the hydrated isoxazole is dehydrated by an acid and the sulfonamide unmasked by treatment with warm aqueous trifluoroacetic acid (TFA) to form the final 10 sulfonamide derivative 20.

Scheme XV

15

Synthetic Scheme XV shows the three step one pot procedure for the preparation of substituted isoxazole derivatives 20. In the first step the desoxybenzoin sulfonamide derivative 26 is protected as the cyclic disilylamine derivative by treatment with 1,2-bis-(chlorodimethylsilyl)ethane in the presence of triethylamine. In step two the cyclic disilylamine protected sulfonamide is treated with excess lithium diisopropylamide followed by quenching of the resulting 20 dianion with an ester to afford the corresponding hydrated isoxazole derivative. In the third step the reaction mixture is treated with aqueous trifluoroacetic acid that effects dehydration of the 25 hydrated isoxazole and unmasks the sulfonamide moiety 30 to afford the desired isoxazole derivative 20.

Scheme XVI

5 Synthetic Scheme XVI illustrates the three step procedure for the preparation of aromatic sulfonamides from aromatic bromides. In step one, the aromatic bromide is transmetallated to the corresponding lithium derivative that is immediately treated with gaseous
10 sulfur dioxide to form an aromatic sulfinic acid. The sulfinic acid is converted directly to the sulfonamide by treatment with aqueous hydroxylamine-O-sulfonic acid and sodium acetate.
15

Similarly, starting with compounds having a (4-bromophenyl) substituent at isoxazole position three, one can prepare isoxazoles having a benzenesulfonamide at position three via this method.

Scheme XVII

20

Synthetic Scheme XVII shows the four step one-pot procedure for the preparation of selected
25 desoxybenzoin d rivatives 30. In the first step a substituted benzaldehyde 29 is converted to the

corresponding trimethylsilyl cyanohydrin by condensation with trimethylsilyl cyanide and a catalytic amount to zinc iodide. In step two the trimethylsilyl cyanohydrin is treated with lithium 5 diisopropylamide to form the acyl anion equivalent that is alkylated by a substituted benzyl bromide to afford the trimethylsilyl cyanohydrin of desoxybenzoin 30. In steps three and four the trimethylsilyl cyanohydrin is first hydrolyzed with aqueous 10 trifluoroacetic acid and hydrochloric acid to produce the corresponding cyanohydrin that is converted to 30 upon treatment with sodium hydroxide.

4-[5-Methyl-3-phenylisoxazol-4-yl]benzenesulfonamide

Step 1. Preparation of desoxybenzoin keto-oxime.

Hydroxylamine hydrochloride (9.21 g, 0.132 mol) and potassium hydroxide (7.43 g, 0.132 mol) were suspended in absolute ethanol (50 mL) and stirred at room temperature for thirty minutes. A solution of desoxybenzoin (20.0 g, 0.102 mol) in toluene (200 mL) was added in one portion, and the yellow suspension was held at reflux under a nitrogen blanket for 16 hours. The suspension was cooled to room temperature and poured into water (200 mL). The system was extracted with ethyl acetate (2x150 mL), and the combined organic solution was washed with brine (200 mL), dried over magnesium sulfate, and filtered. The solvents were evaporated under reduced pressure to yield a crude solid. The solid was recrystallized from hot ethanol/water, filtered and washed with water to yield, upon drying, desoxybenzoin keto-oxime as white crystals (17.7 g, 82%): mp 87-90 °C. Mass spectrum, $\text{MH}^+ = 212$. High resolution mass spectrum Calc'd. for $\text{C}_{14}\text{H}_{13}\text{NO}$: 211.0997. Found: 211.0949.

Step 2. Preparation of 4-[5-methyl-3-phenylisoxazol-4-yl]benzenesulfonamide.

A solution of desoxybenzoin keto-oxime from Step 1 (6.00 g; 28.40 mmol) in anhydrous tetrahydrofuran (THF, 80 mL) was cooled to -20 °C. To this cold solution, n-butyllithium (1.6 N in hexanes, 44.4 mL) was added, via syringe, over 35 minutes, such that the reaction temperature remained at or below -10 °C. The deep red solution was stirred at -10 °C for 1 hour, warmed to room temperature, then stirred at room temperature for an additional hour. Acetic anhydride (3.2 mL, 34.1 mmol) was added in one portion, and the resulting suspension was stirred without temperature control for 2 hours. Water (100 mL) was added, the solution was poured into 1 N HCl (100 mL) and extracted with ethyl acetate (2 X 200 mL). The combined organic solution

was washed with hydrochloric acid (1 N HCl, 100 mL) and brine (100 mL), dried over magnesium sulfate and filtered. The resulting solution was evaporated under reduced pressure to yield a crude oil. The oil was applied to a column of silica gel and eluted with ethyl acetate/hexane (10-50% ethyl acetate) to yield, upon concentration of the appropriate fractions, 5.0 g of 3,4-diphenyl-4-hydrido-5-hydroxy-5-methylisoxazole. The solid was cooled to 0 °C, then dissolved in cold chlorosulfonic acid (15 mL). The brown solution was stirred at 0 °C for 2 hours, then added dropwise to a stirred suspension of ice (200 mL) and dichloromethane (200 mL). The layers were separated, and the organic phase was added directly to a saturated ammonium hydroxide solution (100 mL) at 0 °C. This biphasic solution was vigorously stirred at 0 °C for 2 hours, the layers were separated, and the aqueous phase was washed with dichloromethane (50 mL). The combined organic solution was dried over magnesium sulfate, filtered and evaporated under reduced pressure to approximately one-half of its original volume. Crystals formed. The stirred suspension was cooled to 0 °C and held for 30 minutes. The crystals were filtered, washed with cold dichloromethane and dried to yield 4-[5-methyl-3-phenylisoxazol-4-yl]benzenesulfonamide (2.7 g, 30%): mp 172-173 °C. ^1H NMR ($\text{CD}_3\text{CN}/500$ MHz) δ 7.86 (d, $J=8.39$ Hz, 2H), 7.45 (m, 1H), 7.39 (s, 4H), 7.37 (d, $J=8.39$ Hz, 2H), 5.70 (s, 2H), 2.46 (s, 3H). Mass Spectrum, $\text{MH}^+ = 315$.

EXAMPLE 2

5 [4-[4-(Aminosulfonyl)phenyl]-3-(3-fluoro-4-methoxyphenyl)isoxazol-5-yl]propanoic acid

Step 1: Preparation of 1-(3-fluoro-4-methoxyphenyl)-2-phenyl-ethan-1-one.

A suspension of aluminum chloride (9.4 g, 70.5 mmol) in a solution of 2-fluoroanisole (6.6 mL, 58.8 mmol) and anhydrous chloroform (200 mL) was cooled to 0 °C under a blanket of dry nitrogen. A solution of phenylacetyl chloride (8.6 mL, 64.7 mmol) in anhydrous chloroform (50 mL) was added to the vigorously stirred suspension over 20 minutes keeping the reaction temperature <5 °C. The yellowish solution was stirred at 0 °C for 1 hour, then poured into ice (200 mL) and stirred without temperature control for 16 hours. The layers were separated, and the aqueous layer was extracted with dichloromethane (2x100 mL). The combined organic solution was dried over magnesium sulfate, filtered, and the solvent was evaporated under reduced pressure. The resulting solid was recrystallized from boiling hexane to yield, upon filtration and drying, 12.9 g (90%) of 1-(3-fluoro-4-methoxyphenyl)-2-phenyl-ethan-1-one as white crystals: ¹H NMR (CDCl₃/300 MHz) δ 7.82-7.72 (m, 2H), 7.35-7.24 (m, 5H), 6.98 (dd, J=8.46, 8.26 Hz, 1H), 4.22 (s, 2H), 3.94 (s, 3H). ¹⁹F NMR (CDCl₃/282.2 MHz) -134.875 (m).

Step 2: Preparation of 1-(3-fluoro-4-methoxyphenyl)-2-phenyl-ethan-1-one oxime.

Hydroxylamine hydrochloride (3.7 g, 53.2 mmol) and 5 potassium hydroxide (2.98 g, 53.2 mmol) were suspended in absolute ethanol (25 mL) and stirred for 30 minutes. To this, a suspension of 1-(3-fluoro-4-methoxyphenyl)-2-phenyl-ethan-1-one from Step 1 (10.0 g, 40.9 mmol) in toluene (150 mL) was added in one portion. The yellow 10 suspension was warmed to reflux for 16 hours, then the suspension was cooled to room temperature. Water (100 mL) was added, and the resulting solution was extracted with ethyl acetate (2 X 100 mL). The combined organic solution was washed with brine (100 mL), dried over 15 magnesium sulfate and filtered. The resulting solution was evaporated under reduced pressure to yield a crude residue. The residue was crystallized from boiling ethanol/water to yield, upon filtration and drying 1-(3-fluoro-4-methoxyphenyl)-2 phenyl-ethan-1-one oxime 20 as ivory-colored crystals (10.0 g 94%): ^1H NMR ($\text{CDCl}_3/300$ MHz) δ 7.42 (dd, $J=12.69, 2.01, 1\text{H}$), 7.36-7.19 (m, 6H), 6.89 (dd, $J=8.66, 8.46$ Hz, 1H), 4.16 (s, 2H), 3.88 (s, 3H). ^{19}F NMR ($\text{CDCl}_3/282.2$ MHz): 135.517 (m).

Step 3: [3-(3-fluoro-4-methoxyphenyl)-4-phenyl-isoxazol-5-yl]propanoic acid:

1-(3-Fluoro-4-methoxyphenyl)-2-phenyl-ethan-1-one oxime from Step 2 (2.00 g, 7.71 mmol) and anhydrous THF 30 (80 mL) under a nitrogen blanket was cooled to -20 °C, and n-butyllithium (1.6 N, 12.0 mL) was added, via syringe, over 20 minutes, keeping the reaction temperature <-10 °C. The deep red suspension was stirred at -20 °C for 1 hour, warmed to room 35 temperature, and stirred at room temperature for 1 hour. Succinic anhydride (926 mg, 9.26 mmol) was added in one portion, and the y llow reaction was stirred for

16 hours without temperature control. Sulfuric acid (conc., 2.1 mL) was added, and the reaction was warmed to reflux. After 2 hours, the brown mixture was cooled to room temperature, diluted with water (100 mL), and extracted with ether (2 X 100 mL). The ethereal solution was extracted with dilute sodium hydroxide (2 X 100 mL), and the combined basic extracts were acidified to pH < 2 with hydrochloric acid (conc.). The acidic aqueous phase was extracted with ether (2 X 100 mL). This ethereal solution was evaporated under reduced pressure to a residue. The residue was applied to a column of silica gel (200 cc) and eluted (10% methanol in dichloromethane) to yield, upon concentration of the appropriate fractions, a crude solid. The colorless solution was warmed to reflux and held for 16 hours. The solution was cooled to room temperature and diluted with water (20 mL). The aqueous solution was extracted with ether (2 X 50 mL), and the combined ethereal solution was washed with diluted sodium hydr(30 mL). The organic solution was dried over magnesium sulfate, filtered and evaporat d

under reduced pressure to yield an oil. The oil was cooled to 0 °C, and chlorosulfonic acid (0 °C, 12 mL) was added. 4-[5-Methyl-3-phenyl-4-yl]benzenesulfonamide

(Example 1) (20.965 g, 66.69 mmol) and THF (1.4 L) were cooled to -78 °C (dry-ice/acetone bath) and a

10 premeasured volume of n-BuLi (167 mL, 266.76 mmol) was added, causing the reaction solution to become bright red. After 15 minutes the dry ice/acetone bath was replaced with a NaCl/ice/water bath, the reaction was warmed to -5 °C over 15 minutes and maintained at -5 °C

15 for 30 more minutes. The NaCl/ice/H₂O bath was replaced with a dry ice/acetone bath and the reaction was chilled to -71 °C. Oxygen was added via two 14 gauge needles (ca. 4 psi) and a similar outlet provided. Within 10 minutes the reaction, formerly a

20 red suspension, became an ocre-yellow suspension. Oxygen addition was continued for 30 more minutes. The oxygen line and vents were removed and trimethyl phosphite (67 mL, 566.97 mmol) was added via syringe.

After 15 minutes, a solution of HOAc (125 mL) and H₂O

temperature. Brine (700 mL) and 1 N HCl (134 mL) were

30 added and stirred for 15 minutes. Ethyl acetate (700 mL) was added and the layers were separated. The

aqueous phase was washed with ethyl acetate (150 mL) and the organic layers were combined. The organic layer was washed with water, NaHCO_3 (5 x 100 mL) and brine, dried over anhydrous MgSO_4 , and filtered.  15 warmed to 0 °C, cooled back to -40 °C, and treated with a solution of one equivalent of glutaric anhydride in THF (5 mL). The solution was warmed to room temperature and maintained at this temperature for 2 hours. The crude reaction was quenched with
 20 saturated NH₄Cl and concentrated HCl was added until the pH was 2. The resulting mixture was extracted with ethyl acetate and the combined organic phases were washed with brine, dried over MgSO₄, filtered, and concentrated *in vacuo*, yielding a brown oil. A
 25 solution of the brown oil (3.10 g) in THF (50 mL) was treated with concentrated H₂SO₄ (2 mL) and heated to reflux for 2 hours. The reaction was cooled to room temperature, diluted with brine and the layers separated. The aqueous phase was extracted with ethyl
 30 acetate, and the organic phases were combined. The combined phases were washed with water until the washes were pH 5 or higher. The organic phase was dried over MgSO₄, filtered, and concentrated *in vacuo*,

yielding a brown oil. This oil was purified by flash chromatography using hexane/ethyl acetate (3:1) (with 22% acetic acid), yielding the 4-[4-[4-[N-[2,5-dimethylpyrrol]-sulfonyl]phenyl]]-3-phenyloxazol-5-yl]butan-1-oic acid (1.327 g, 17% based upon oxime) as a tan foam, which was suitable for use without further purification. ^1H NMR ($\text{CDCl}_3/300$ MHz) 7.65 (d, $J = 8.66$ Hz, 2H), 7.43-7.25 (m, 7 H), 5.88 (s, 2H), 2.88 (t, $J = 8.4$ Hz, 2H), 2.48-2.37 (m, 8 H), 2.18-2.02 (m, 2H).

BIOLOGICAL EVALUATION

Rat Carrageenan Foot Pad Edema Test

The carrageenan foot edema test was performed with materials, reagents and procedures essentially as 30 described by Winter, et al., (Proc. Soc. Exp. Biol. Med., 111, 544 (1962)). Male Sprague-Dawley rats were selected in each group so that the average body weight was as close as possible. Rats were fasted with free access to water for over sixteen hours prior to the 35 test. The rats were dosed orally (1 mL) with compounds suspended in vehicle containing 0.5% methylcellulose and 0.025% surfactant, or with vehicle alone. One hour later a subplantar injection of 0.1

mL of 1% solution of carrageenan/sterile 0.9% saline was administered and the volume of the injected foot was measured with a displacement plethysmometer connected to a pressure transducer with a digital indicator. Three hours after the injection of the carrageenan, the volume of the foot was again measured. The average foot swelling in a group of drug-treated animals was compared with that of a group of placebo-treated animals and the percentage inhibition of edema was determined (Otterness and Bliven, *Laboratory Models for Testing NSAIDs, in Non-steroidal Anti-Inflammatory Drugs*, (J. Lombardino, ed. 1985)). The % inhibition shows the % decrease from control paw volume determined in this procedure and the data for selected compounds in this invention are summarized in Table I.

Rat Carrageenan-induced Analgesia Test

The rat carrageenan analgesia test was performed with materials, reagents and procedures essentially as described by Hargreaves, et al., (*Pain*, 32, 77 (1988)). Male Sprague-Dawley rats were treated as previously described for the Carrageenan Foot Pad Edema test. Three hours after the injection of the carrageenan, the rats were placed in a special plexiglass container with a transparent floor having a high intensity lamp as a radiant heat source, positionable under the floor. After an initial twenty minute period, thermal stimulation was begun on either the injected foot or on the contralateral uninjected foot. A photoelectric cell turned off the lamp and timer when light was interrupted by paw withdrawal. The time until the rat withdraws its foot was then measured. The withdrawal latency in seconds was determined for the control and drug-treated groups, and percent inhibition of the hyperalgesic foot withdrawal determined. Results are shown in Table I.

15 Evaluation of COX-1 and COX-2 activity *in vitro*

The compounds of this invention exhibited inhibition *in vitro* of COX-2. The COX-2 inhibition activity of the compounds of this invention illustrated in the Examples was determined by the following methods.

a. Preparation of recombinant COX baculoviruses

Recombinant COX-1 and COX-2 were prepared as described by Gierse et al, [J. Biochem., 305, 479-84 (1995)]. A 2.0 kb fragment containing the coding region of either human or murine COX-1 or human or murine COX-2 was cloned into a BamH1 site of the baculovirus transfer vector pVL1393 (Invitrogen) to generate the baculovirus transfer vectors for COX-1 and COX-2 in a manner similar to the method of D.R. O'Reilly et al (*Baculovirus Expression Vectors: A Laboratory Manual* (1992)). Recombinant baculoviruses were isolated by transfecting 4 µg of baculovirus transfer vector DNA into SF9 insect cells (2×10^8) along with 200 ng of linearized baculovirus plasmid DNA by the calcium phosphate method. See M.D. Summers and G.E. Smith, *A Manual of Methods for Baculovirus Vectors and Insect Cell Culture Procedures*, Texas

Agric. Exp. Station Bull. 1555 (1987). Recombinant viruses were purified by three rounds of plaque purification and high titer (10^7 - 10^8 pfu/mL) stocks of virus were prepared. For large scale production, SF9 5 insect cells were infected in 10 liter fermentors (0.5×10^6 /mL) with the recombinant baculovirus stock such that the multiplicity of infection was 0.1. After 72 hours the cells were centrifuged and the cell pellet homogenized in Tris/Sucrose (50 mM: 25%, pH 8.0) 10 containing 1% 3-[(3-cholamidopropyl)dimethylammonio] - 1-propanesulfonate (CHAPS). The homogenate was centrifuged at 10,000xG for 30 minutes, and the resultant supernatant was stored at -80°C before being assayed for COX activity.

15

b. Assay for COX-1 and COX-2 activity

COX activity was assayed as PGE₂ formed/ μ g protein/time using an ELISA to detect the prostaglandin released. CHAPS-solubilized insect cell 20 membranes containing the appropriate COX enzyme were incubated in a potassium phosphate buffer (50 mM, pH 8.0) containing epinephrine, phenol, and heme with the addition of arachidonic acid (10 μ M). Compounds were pre-incubated with the enzyme for 10-20 minutes prior 25 to the addition of arachidonic acid. Any reaction between the arachidonic acid and the enzyme was stopped after ten minutes at 37 °C/room temperature by transferring 40 μ l of reaction mix into 160 μ l ELISA buffer and 25 μ M indomethacin. The PGE₂ formed was 30 measured by standard ELISA technology (Cayman Chemical). Results are shown in Table II.

Biological paradigms for testing the cytokine-inhibiting activity of these compounds are found in WO95/13067, published 18 May 1995.

Also embraced within this invention is a class of pharmaceutical compositions comprising the active compounds of this combination therapy in association with one or more non-toxic, pharmaceutically-acceptable carriers and/or diluents and/or adjuvants (collectively referred to herein as "carrier" materials) and, if desired, other active ingredients. The active compounds of the present invention may be administered by any suitable route, preferably in the form of a pharmaceutical composition adapted to such a route, and in a dose effective for the treatment intended. The active compounds and composition may, for example, be administered orally, intravascularly, intraperitoneally, subcutaneously, intramuscularly or topically.

For oral administration, the pharmaceutical composition may be in the form of, for example, a tablet, capsule, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a particular amount of the active ingredient. Examples of such dosage units are tablets or capsules. The active ingredient may also be administered by injection as a composition wherein, for example, saline, dextrose or water may be used as a suitable carrier.

The amount of therapeutically active compounds that are administered and the dosage regimen for treating a disease condition with the compounds and/or compositions of this invention depends on a variety of factors, including the age, weight, sex and medical condition of the subject, the severity of the disease, the route and frequency of administration, and the particular compound employed, and thus may vary widely. The pharmaceutical compositions may contain active ingredients in the range of about 0.1 to 2000 mg, preferably in the range of about 0.5 to 500 mg and most preferably between about 1 and 100 mg. A daily dose of about 0.01 to 100 mg/kg body weight, preferably between about 0.5 and about 20 mg/kg body weight and most preferably between about 0.1 to 10 mg/kg body weight, may be appropriate. The daily dose can be administered in one to four doses per day.

In the case of psoriasis and other skin conditions, it may be preferable to apply a topical preparation of compounds of this invention to the affected area two to four times a day.

For inflammations of the eye or other external tissues, e.g., mouth and skin, the formulations are preferably applied as a topical ointment or cream, or as a suppository, containing the active ingredients in a total amount of, for example, 0.075 to 30% w/w, preferably 0.2 to 20% w/w and most preferably 0.4 to 15% w/w. When formulated in an ointment, the active ingredients may be employed with either paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an oil-in-water cream base. If desired, the aqueous phase of the cream base may include, for example at least 30% w/w of a polyhydric alcohol such as propylene glycol, butane-1,3-diol, mannitol, sorbitol, glycerol, polyethylene glycol and mixtures thereof. The topical formulation may desirably include a compound which enhances absorption or penetration of

the active ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethylsulfoxide and related analogs. The compounds of this invention can also be 5 administered by a transdermal device. Preferably topical administration will be accomplished using a patch either of the reservoir and porous membrane type or of a solid matrix variety. In either case, the active agent is delivered continuously from the 10 reservoir or microcapsules through a membrane into the active agent permeable adhesive, which is in contact with the skin or mucosa of the recipient. If the active agent is absorbed through the skin, a controlled and predetermined flow of the active agent 15 is administered to the recipient. In the case of microcapsules, the encapsulating agent may also function as the membrane.

The oily phase of the emulsions of this invention may be constituted from known ingredients in a known 20 manner. While the phase may comprise merely an emulsifier, it may comprise a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which 25 acts as a stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make-up the so-called emulsifying wax, and the wax together with the oil and fat make up the so-called emulsifying ointment base 30 which forms the oily dispersed phase of the cream formulations. Emulsifiers and emulsion stabilizers suitable for use in the formulation of the present invention include Tween 60, Span 80, cetostearyl alcohol, myristyl alcohol, glyceryl monostearate, and 35 sodium lauryl sulfate, among others.

The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties, since the solubility of the active

compound in most oils likely to be used in pharmaceutical emulsion formulations is very low. Thus, the cream should preferably be a non-greasy, non-staining and washable product with suitable
5 consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl
10 palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters may be used. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such as white soft paraffin and/or liquid
15 paraffin or other mineral oils can be used.

Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredients are dissolved or suspended in suitable carrier, especially an aqueous solvent for the active
20 ingredients. The antiinflammatory active ingredients are preferably present in such formulations in a concentration of 0.5 to 20%, advantageously 0.5 to 10% and particularly about 1.5% w/w.

For therapeutic purposes, the active compounds of
25 this combination invention are ordinarily combined with one or more adjuvants appropriate to the indicated route of administration. If administered per os, the compounds may be admixed with lactose, sucrose, starch powder, cellulose esters of alkanoic
30 acids, cellulose alkyl esters, talc, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulfuric acids, gelatin, acacia gum, sodium alginate, polyvinylpyrrolidone, and/or polyvinyl alcohol, and
35 then tableted or encapsulated for convenient administration. Such capsules or tablets may contain a controlled-release formulation as may be provided in a dispersion of active compound in hydroxypropylmethyl

cellulose. Formulations for parenteral administration may be in the form of aqueous or non-aqueous isotonic sterile injection solutions or suspensions. These solutions and suspensions may be prepared from sterile 5 powders or granules having one or more of the carriers or diluents mentioned for use in the formulations for oral administration. The compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, peanut oil, sesame 10 oil, benzyl alcohol, sodium chloride, and/or various buffers. Other adjuvants and modes of administration are well and widely known in the pharmaceutical art.

Although this invention has been described with respect to specific embodiments, the details of these 15 embodiments are not to be construed as limitations.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 18-23 are directed to a method of treatment of the human body, the search has been carried out and based on the alleged effects of the compounds.
2. Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
- No protest accompanied the payment of additional search fees.
